

# **Japan-China Regional economic integration and Asian economic growth: Influence on Japanese economy**

**Toshiaki Hasegawa**

**Yasuhiko Sasai**

**Takeshi Imagawa**

**Mitsuhito Ono<sup>1</sup>**

*In this paper, our purpose is to forecast the influence of Japan-China Free Trade Agreement on Japanese economy to describe macroeconomic figure and also industry specific figures. Our approach has some characteristics different from the previous researchers' approaches. Firstly, the approach in this paper is based on INFORUM approach which has the tools of Interindustry analysis to integrate econometric approach for constructing dynamic macroeconomic model. This type of INFORUM approach is different from vastly simplified CGE (Computational General Equilibrium) approach<sup>2</sup>. Secondly, our policy simulation seems to be different from Jagdish Bhagwati's assertion<sup>3</sup> on FTA approach not to liberalize markets regionally. Bhagwati has strongly inclined toward an assertion of policy alternative based on WTO framework for global liberalization. Thirdly, we attempted to link Japanese JIDEA model and Chinese MUDAN model directly, which are INFORUM type Input-Output based dynamic macroeconomic models.*

## **Growth and International trade in Asia**

INFORUM partner can use the value of world trade estimated in BTM system<sup>4</sup>. **Figure 1** shows BTM forecasting of the world trade trend and its structure until 2010. In twenty five years from 1985 to 2010, the value of world trade will grow about four times. Japanese share in the world trade was 13 percentages in 1985. Added the exports from two countries, Japan and China, trade share of two countries in the world will be almost unchanged, in which the share of two countries will be 15.5 percentages in 2010.

The trade share of NAFTA which consists of the United State, Canada and Mexico will be twenty percentages in 2010. The countries of NAFTA, the European countries and the rest of OECD countries will slightly decrease their trade share in the world to be from 66 percentages in 1985 to 58 percentages in

<sup>1</sup> The authors have constructed and operated JIDEA model jointly since 1993, supported by the Institute for International Trade and Investment (ITI). Hasegawa and Imagawa belong to Faculty of Economics, Chuo University. Sasai belongs to Kyoei University and Ono belongs to JETRO. Sasai and Ono also have worked for ITI. This paper was jointly prepared in JIDEA working group for the memorial symposium of Institute of Economic Research, Chuo University. The authors cordially appreciate Wang Yinchu who contributed to constructing the research framework, and Douglas Nyhus who prepared the data of Japanese export expansion to China due to tariff removal. Also, we express our gratitude to Wang and Nyhus in making the modification of JIDEA model to version 5.1. Wang is one of the persons who are operating MUDAN model in China. Nyhus is currently responsible for operating BTM system in INFORUM project.

2010. The trade share of ROW (the rest of the countries; the developing countries) will be unchanged. The increase of trade share will occur in Asian countries. In this sense, Asian countries have a dynamic pulling power in the world economy.

\* Defined as Asia excluding Japan, Australia and New Zealand.

Next to EU and NAFTA, etc., the conclusions of PTAs (Preferential Trade Agreements) have grown in Asia. According to the notification to WTO to the end of 2002, RTAs (Regional trade agreements) in the world have been notified which number might approach 300 by the end of 2005. Asian economies have experienced the highest economic growth and the highest growth of trade in the world. **Table 1**<sup>5</sup> shows that the external trade in Asia has grown much higher than their growth of GDP. Among Asian countries, Japan and China are becoming the competing economies to have the strong influence on the other economies. Under this economic performance of Japan and China, both countries have taken interest in the

<sup>5</sup> World Trade Developments in 2002 & Prospects for 2003, WTO, 2003.

conclusion of PTA between both countries. In this analysis, PTA is defined in the meaning of tariff removal on the mutual trade.

### **Import tariff in Japan**

In the CGE model mentioned above, Tutumi assumed the international price differences as the result caused totally by import tariff. It is relatively difficult to acquire the data of tariff rate in an operational style. Ad-valorem tariff rate and specific tariff are printed together in the Effective tariff rate 2003 for Japanese custom duties. **Table 2** illustrates some samples of Japanese tariff structure. The database includes various tariff rates such as base1, base2, wto1, wto2, preferential, and provisional tariff rates in terms of ad-valorem or specific tariff rate.<sup>6</sup> The database of effective import tariff rate in Japan is mainly described in two kinds of tariff rates; ad-valorem tariff according to worth and specific tariff according to weight. The tariffs of wheat and rice polished are defined in specific tariff. The case of passenger's car is defined to impose in ad-valorem tariff, which is described as free of tariff. Specific tariff is expressed in Japanese Yen in the column of unit2 such as MT, KG, etc.

**Table 2 Sample of Effective Tariff Rate in Japan**

HS9	NACC S	Description	base1	base2	wto1	wto2	preferential	provisional	Unit 1	Unit2
1001900 19	6	wheat	(\65/kg)	(\65/kg)	0			0	MT(=ton)	
1006300 90	1	rice polished (other)	(\40/kg)	(\402/kg)	*(\341/kg)			\49/kg	MT	
6103110 10	1	suits for man	16.80%	0.168	11.50 %	10.90 %	x0		NO	KG
8703230 00		Passengers' car (1,500cm <sup>3</sup> ~3,000cm <sup>3</sup> )	0	0	0				NO	

The simulation of this paper is an application of JIDEA model, version 5.1 which is currently operated jointly by ITI and Chuo JIDEA working group.<sup>7</sup> Japanese industries in current JIDEA model are classified into 100 sectors, of which the tradable sector consists of 63 sectors from the 1<sup>st</sup> to 64<sup>th</sup> sector, where the 3<sup>rd</sup> sector of agriculture service do not have foreign trade. Such trade data was introduced from MOF's trade statistics.<sup>8</sup> Although Non-tradable sector from 65<sup>th</sup> to 100<sup>th</sup> sector has also the data of foreign exchange in Input-Output table, we could use such a data as a service trade in the Japan-China FTA simulation.

The import ad-valorem tariff rate used in JIDEA 5.1 was re-classified in 100 sectors from the original database of import tariff rate on import from China for 5798 commodities in 9 digit code. In order to make the ad-valorem tariff rate, the commodity sectors in trade statistics were arranged to be classified into the sectors used in tariff rate database. **Table 3** shows the result of Ad-valorem tariff rate for JIDEA 100 sectors calculated in our procedure. Tens of thousands of items in tariff table were aggregated in

<sup>6</sup> JTASS (ed.), Zeiron 2003, Japan Tariff Association, 2003. (2003.CD-ROM version for the integrated database of Effective tariff rate 2003 and the related statistics)

<sup>7</sup> JIDEA model has been constructed in "G" program which was developed by Clopper Almon. G and the related programs are explained in Clopper Almon, Craft of Economic Modelling, IERF, Inc., 1999. Japanese edition includes some applications into Japanese model and explanation of BTM system. JIDEA model is described in Yasuhiko Sasai et al., The model of Japan Interindustry Dynamic Econometric Analysis, ITI, 1996 and 2003.

<sup>8</sup> Ministry of Finance, Trade Statistics, ( customs clearance base ), 2002.

accordance with the code of trade statistics at the first step. In the aggregated table, still more than five thousand items, specific tariff were transformed into Ad-valorem tariff rate. The table of Ad-valorem tariff rate in Table 2 shows the calculated tariff rate which is the divided value of aggregated tariff revenue by the aggregated import value in each 100 sectors. We can identify 15 tariff-imposing sectors in JIDEA tradable 64 sectors in the above table of tariff on Chinese products. The imports from China in the rest of the sectors are the sectors with duty-free tariff.

The industries which have the high ad-valorem tariff rate on the products originating from China are Fabricated textile products of 19.04 percentage, and Agriculture for crops of 3.42 percentage. Totally to evaluate the import tariff on Chinese product which is the total tariff revenue on products originating from China divided the total import value from China, this simple average tariff rate was 0.44 percentage in 2003.

### **Three regions of FTA; Japan, China, and the rest of the world in trade data preparation**

This paper simulates the influence of FTA between Japan and China to forecast the macro and micro variables in JIDEA model until 2010. In this analysis, JA denotes Japan, CN for China, and RW means the rest of the world. Basic equation of the country's export is expressed by the following form;

$$JA\exp RW = f(\text{relpri}, \text{fdmrw}, \text{timet}, \text{dum85y}, \text{dum90y})$$

The trade change due to tariff removal is estimated by relative price change between the prices of foreign products and the domestic products. In this sense, we elaborated that key equations are specified and estimated to work price sensible.

The partners of FTA have the following export equations.

$$\begin{aligned} JA\exp CN &= f(\text{relpri}; \dots) = f(JApimCN / pdd_{JA}; \dots) \\ JA\exp RW &= f(\text{relpri}; \dots) = f(JApimRW / pdd_{JA}; \dots) \\ CN\exp JA &= f(\text{relpri}; \dots) = f(CNpimJA / pdd_{CN}; \dots) \\ CN\exp RW &= f(\text{relpri}; \dots) = f(CNpimRW / pdd_{CN}; \dots) \end{aligned}$$

Main concern in this paper is to estimate the trade change for the partner countries, Japan and China after the import tariff removal in Free Trade Agreement. FTA in this paper means the removal of import tariff. Simulations were originally designed by link of each country's Input-Output analysis based dynamic macro econometric model which are called JIDEA for Japanese model and MUDAN for Chinese model<sup>9</sup>.

The static effects of FTA (Free Trade Agreement) consist of two parts in trade changes, that is, the trade diversion and the trade creation. Analytical concept for the trade change as a result of FTA between both countries is illustrated in **Figure 2**. We designed three kinds of forecasting until 2010 in JIDEA model, version 5.1. The original trade data in JIDEA 5.0 as a partner model is essentially linked to Bilateral Trade Model (BTM)<sup>10</sup> in INFORUM systems. The sector numbers of JIDEA tradables has 64, and BTM has

<sup>9</sup> Li Shangtong et al., "A Macroeconomic Multisectoral Dynamic Model of China's Economy (MuDan)," Quantitative and Technical Economics, Vol. 12, 1995.

<sup>10</sup> Qiang Ma, "A Multisectoral Bilateral Trade Model," INFORUM Working Paper, 95006R, 1996.

120 sectors. Chinese MUDAN model has another numbers of sectors. BTM, Bilateral Trade Model in INFORUM models provides the import price from the rest of the world and the exports to the rest of the world for each satellite countries which consists of 16 regions. The first step of this work was to separate such trade data to the two parts, that is, the data for China and for the rest of the world (ROW). The result of this manipulation in trade data are denoted by the name of variables in **Table 4**.

**Table 4 Notation of Japan-China trade link**

## **Simulation Results**

In Simulation 1 (**sm1**), we made an assumption that unilateral tariff removal for Chinese products were introduced by Japan at the year 2003. In the next step in Simulation 2 (**sm2**), we also assumed the case of mutual import tariff removal where Japan and China have to remove import tariff barriers. In Simulation 2, mutual changes in import expansion due to mutual tariff removal should be estimated in terms of their own model, and each has to provide the result of trade change for the partner. Such partner's import expansion might be influenced on the domestic economy as an export increase in a dynamic context. To be exact, this kind of trade data has to be exchanged mutually until convergence in each multiplier process. Original BTM system has this integrated mechanism to calculate the convergence. Our initial work was designed to construct in a framework of two-country model directly to link Japan and China. For the time restriction, we had to calculate the influence of the external trade shock as once for all.<sup>11</sup>

General Equilibrium Analysis such like JIDEA model or other Input-Output analysis can describe the comparative results in the growing industries and the declining industries separately. We used the observed data of Input-Output tables from 1985 to 1998 in JIDEA model. JIDEA model starts the forecasting from 1998. However, we could introduce the recent macroeconomic variables in the model. The simulation of tariff removal was set to begin at 2003.

Net influence of RTA between Japan China on Japanese macro economy is summarized in **Table 5**. The first line describes the value of each macroeconomic variable. The second and third lines indicate the difference from the value of Baseline for to the values of the unilateral tariff removal and multilateral tariff removal.

From our forecasting in **Table 6** for the broad sectoral summary in 29 sectors re-classified from 100, we observed that the mutual tariff removal in our simulation 2 (**sim2**) would expand the total output by 21.9 million Yen from the level of Baseline (**base**). Total import from China expands by 67 million Yen from baseline in 2010. Total export to China expands 87 million Yen. Net effect of employment is the increase of 9880 employee from the level of Baseline in 2010. Decrease of employment was observed in such sectors in 1, 3, 4, 5, 13, and 16 in **Table 6**. Correspondingly to this employment change, the lower levels of gross domestic output by sector were estimated in the sectors 1, 3, 4, 5, 16, and 28. These sectors are supposed be less competitive in foreign trade. Contrary to these diminishing industries, the rest of the industries would be totally growing until 2010. We could observe that the size of growth would be larger than the absolute size of decline.

Broad sectoral summary in Table 5 was manipulated from the precise table from **Table 7** for JIDEA 100 sectors. In **Figure 3 and 4**, we show the trends of Japanese total export and import for the specific biggest 10 industries until 2010 in Baseline. And, **Figure 5 and 6** illustrated the trends of such biggest 10 exports to China and imports from China.

Summary tables of Table 4, 5, and 6 imply that the positive effects in the growing industries mainly caused by Chinese tariff removal are greater than the negative effects in the declining industries mainly

<sup>11</sup> Lack of time forced us to use the trade data of Chinese import expansion due to their import tariff removal which were prepared by Douglas Nyhus in his former research; Douglas Nyhus, "A Study of China's Entry into the World Trade Organization", in INFORUM MODEL: Modelling & Applications, Proceedings of the VIIth INFORUM World Conference, China Financial & Economic Publishing House, 2002. In Nyhus's data, same calculation of ad-valorem tariff rate as we calculated precisely in JIDEA model work has not been done.

*caused by Japanese tariff removal, leading Japanese economy more beneficial due to the RTA conclusion between Japan and China.*
